## Programme

```
data Prog sig a = Return a
                | Op (sig (Prog sig a))
```

```
data Free f a = Pure a
              | Free (f (Free f a))
```

## Programmsignaturen

```
data (sig1 + sig2) cnt = Inl (sig1 cnt)
                      | Inr (sig2 cnt)
```

```
class (Functor sub, Functor sup) => sub <: sup where
  inj :: sub a -> sup a
  prj :: sup a -> Maybe (sub a)
```

# Beispieleffekte

Effektfreie Programme

```
data Void cnt
```

```
data VoidProg a = Return a
```

Nichtdeterministische Programme

```
data ND p = Fail | Choice p p
```

```
data NDProg a = Return a  
              | Fail  
              | Choice (NDProg a) (NDProg a)
```

# Handler

Effekte werden durch **Handler** verarbeitet.

```
run :: Prog Void a -> a
run (Return x) = x
```

```
runND :: (Functor sig)
        => Prog (ND + sig) a -> Prog sig (Tree a)
runND (Return a) = return (Leaf a)
runND Fail      = return Failed
runND (Choice m p q) = do
    pt <- runND p
    qt <- runND q
    return (Choice m pt qt)
runND (Other op) = Op (fmap runND op)
```

# Beispielprogramme

```
coin :: Prog (ND + Void) Int
coin = Choice (return 0) (return 1)
```

```
λ> run . runND $ coin
Choice (Leaf 0) (Leaf 1)
```

```
λ> putStrLn . pretty . run . runND $ addM coin coin
?
|---- ?
    |---- 0
    |---- 1
|---- ?
    |---- 1
    |---- 2
```

```
data State s p = Get (s -> p)  
                | Put s p
```

```
data State s p = Get (s -> p)  
                | Put s p
```
